Rain also occurs in cycles. Water evaporates from the oceans and rises into the sky. This means that the ocean water is warmed by the sun and some of it rises into the air. When enough water has gathered together, big rain clouds form. The clouds will release or drop the water. The rain falls on land and ocean alike. When the rain falls on land, the ground soaks up some of it. If a lot of rain falls, the runoff flows into streams, rivers, and lakes. This water, in turn, flows into the oceans. When some of this water evaporates into the air, the cycle repeats itself.

evaporate 蒸發

soak up 吸收
