For years, we have all thought the Earth was the only blue dot up the sky. Now another has been found. Its name is HD189773b. HD189773b is an exoplanet, a planet outside our Solar System, and is one of the nearest exoplanets to Earth. Even so, we cannot really call it a neighbor. The reason is that it is 63 light years away! That means it is 370,440,000,000,000 miles from us. Even if we fly at 3,500 miles an hour, it will take more than 12 million years to get there. Except for its blue color, HD 189773b is nothing like our home planet.
